### 技术规格

<b>Background:</b>	This gene encodes the regulatory subunit of the inhibitor of kappaB kinase (IKK) complex, which activates NF-kappaB resulting in activation of genes involved in inflammation, immunity, cell survival, and other pathways. Mutations in this gene result in incontinentia pigmenti, hypohidrotic ectodermal dysplasia, and several other types of immunodeficiencies. Multiple transcript variants encoding different isoforms have been found for this gene.
<b>Applications:</b>	WB
<b>Name of antibody:</b>	IKBKG(Phospho-Ser85)
<b>Immunogen:</b>	Peptide sequence around phosphorylation site of serine 85 (Q-A-S(p)-Q-R) derived from Human IKK-gamma.
<b>Full name:</b>	inhibitor of kappa light polypeptide gene enhancer in B-cells, kinase gamma
